

## Managing hydrographic data for multiple usage

Mark Terlien

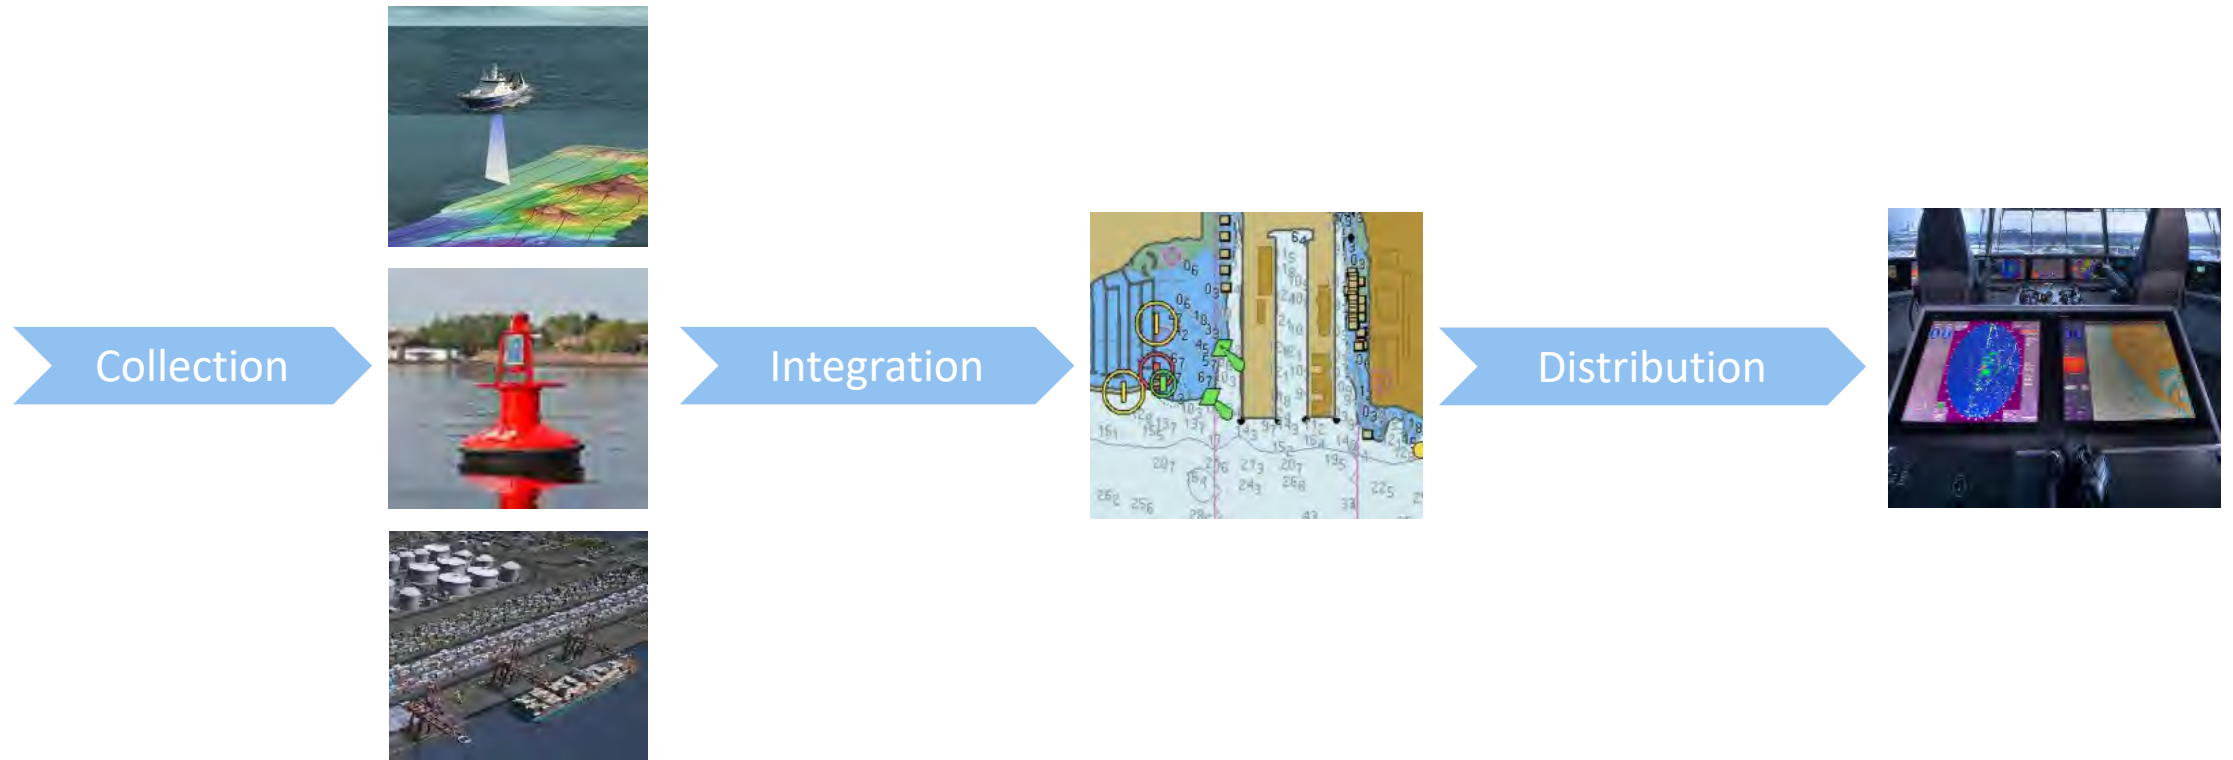

## Introduction

- Mark Terlien, Director Product Development IntellinQ
- IntellinQ was founded in 2013
- Focus on spatial data management:
  - GeolinQ: Web-based solution for spatial data management
  - C-MAP BathymetryManager: Bathymetry Management system

mass population migration  
human geography

## Hydrographic Data Management evolution

- **Past:**

- File based, manual product compilation

- **Now:**

- Enterprise data, automatic product generation and single channel distribution

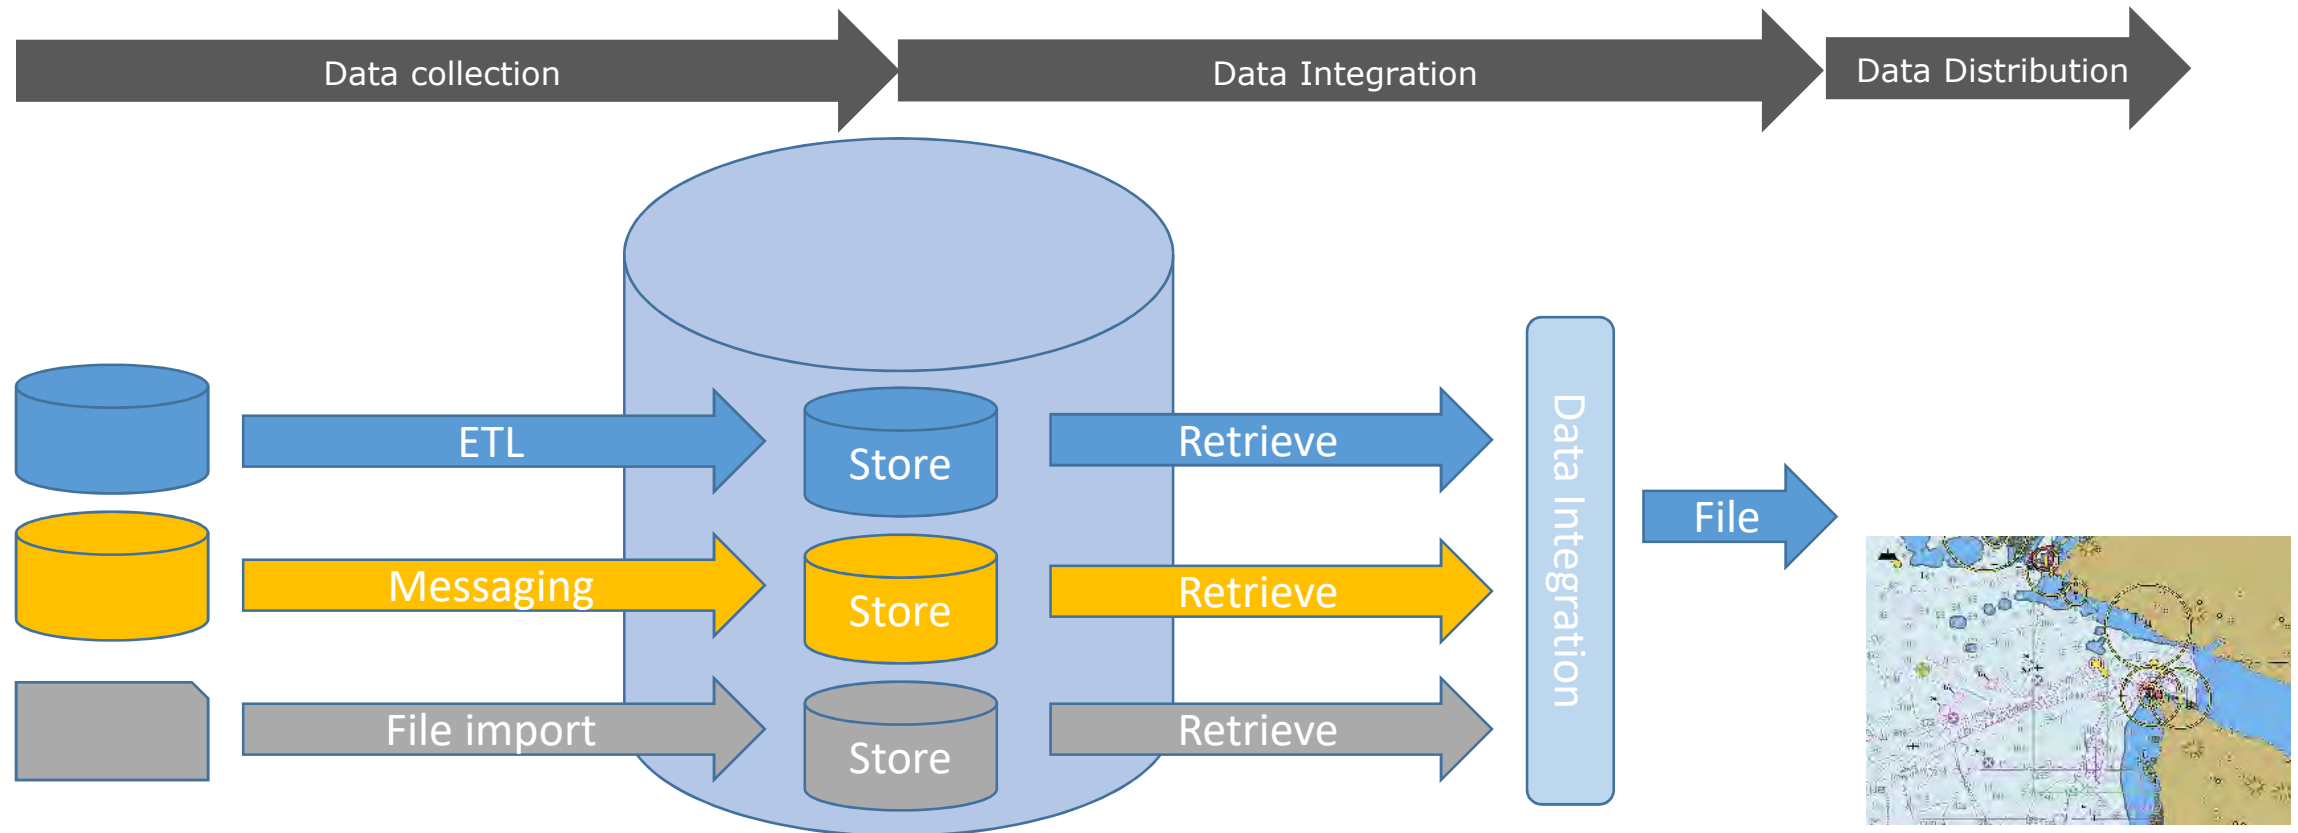

- **Future:**

- Virtual data base, automatic multiple product generation and multiple channel distribution

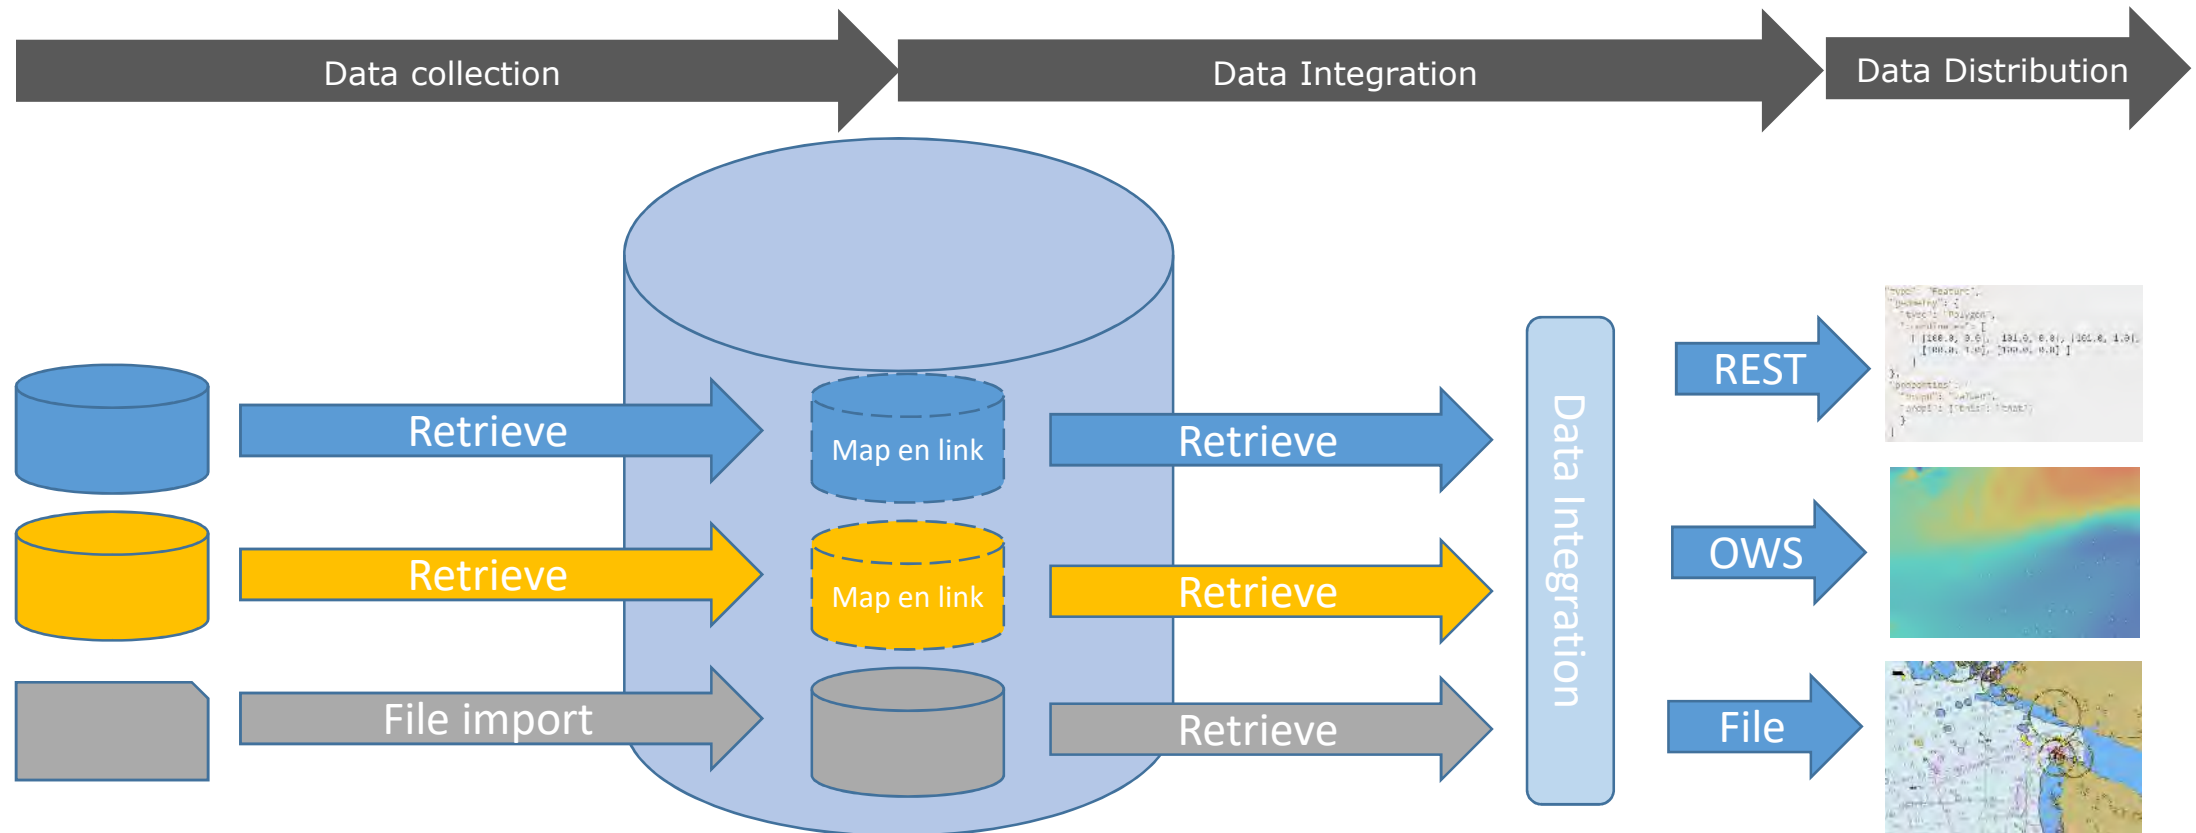

## Hydrographic Data Management: Now

## Integration of maritime datasets into information products

- Challenges:
  - Increasing data volumes
  - Variety of internal and external data sources (e.g. open data)
  - Access to data instead of downloading pre-defined products,
  - Different technologies to access and publish data (SOAP, REST, OWS, files)

## Hydrographic Data Management: Future

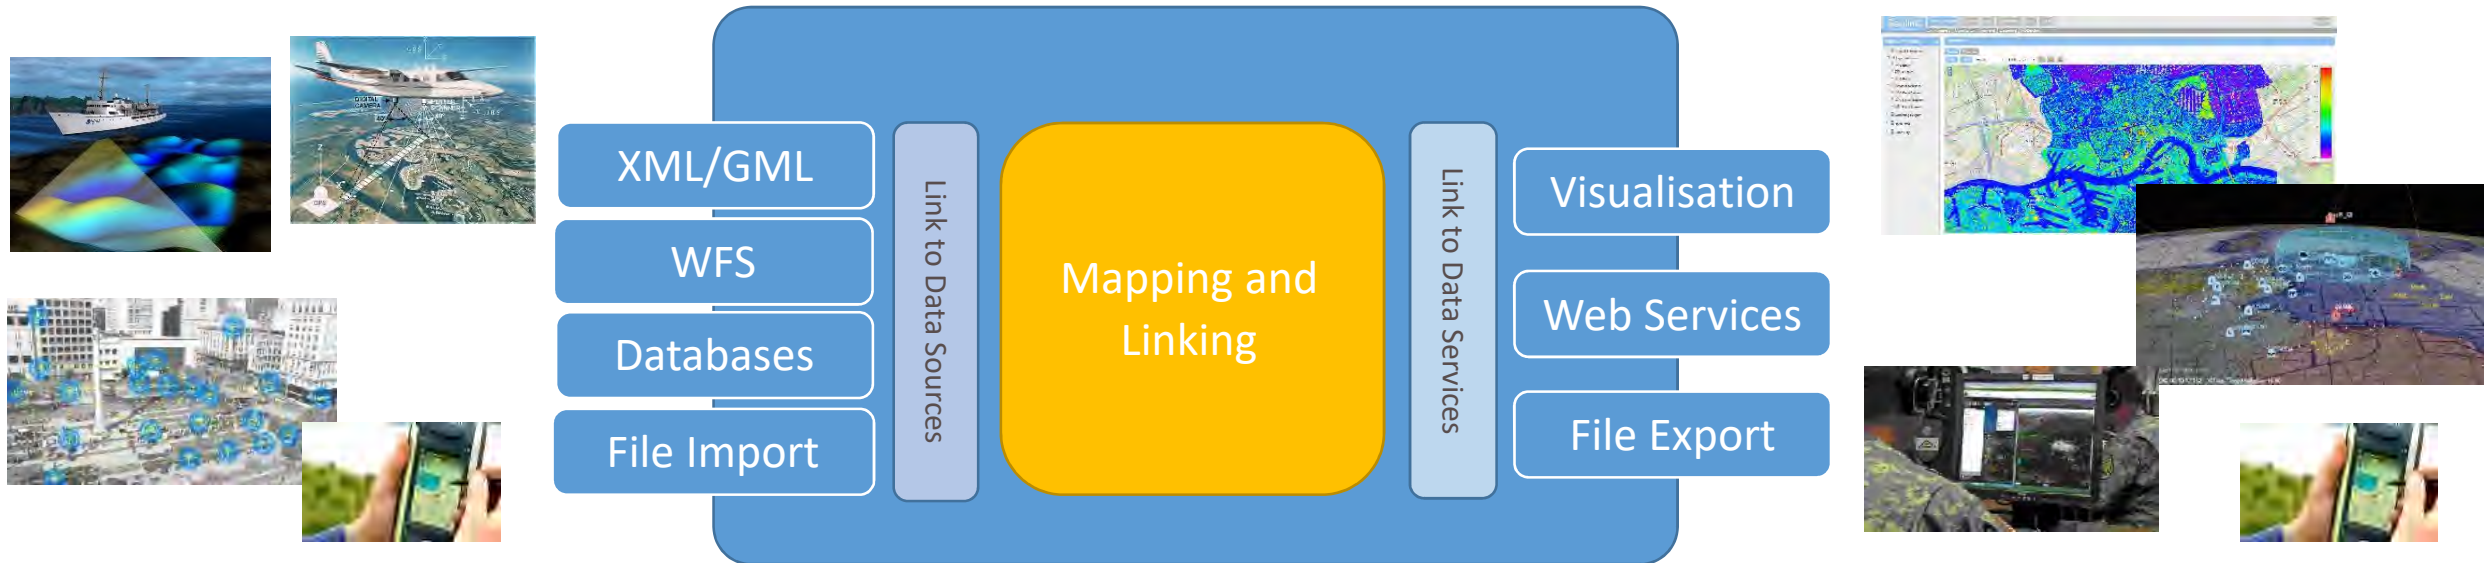

## In the future situation:

- Reduction of number of ETL processes
- Real-time data access
- Product generation on-demand
- Data virtualization (get data from source directly)
- Multiple channels for data distribution

# IntellinQ

Spatial Data Management

## GeolinQ Data Management Concept

Data Sources

Data Models

Data Services

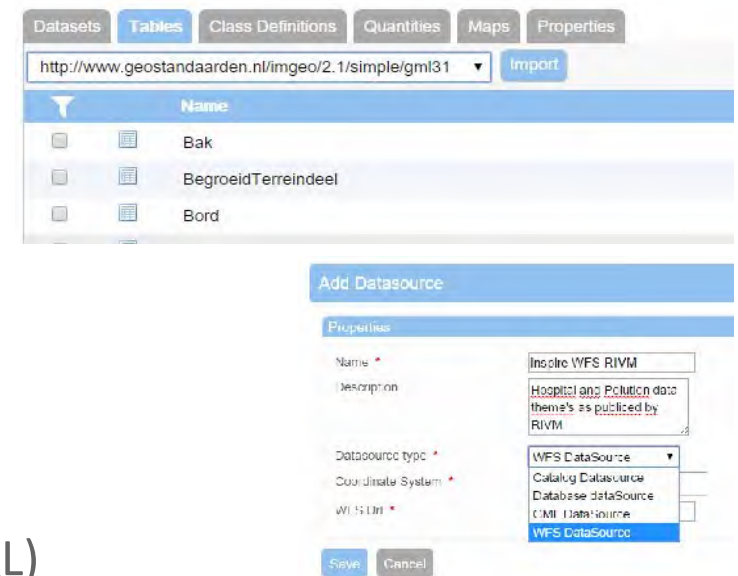

## Hydrographic Data Management software

- Future requirements
  - Multiple datasources
  - No pre-defined data models and changing metadata definitions
  - Data mapping and linking
  - Point cloud management and distribution
  - Importance of metadata (traceability, liability)

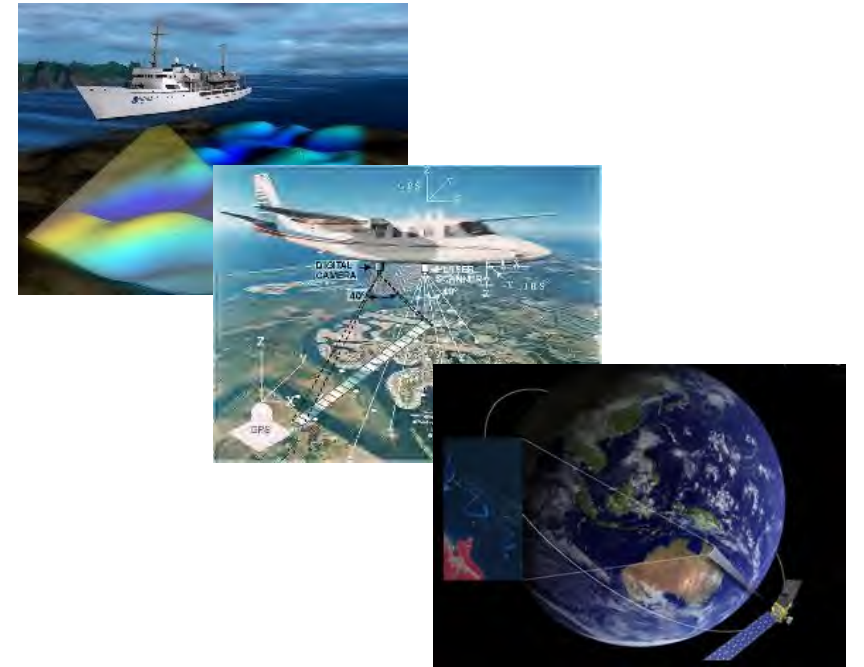

## Multiple data Sources: create a data hub

- Catalog Data Source
  - Create model manually
- GML/XML Data source
  - Generate model from GML and XML XSD's
- WFS Data source
  - Generate model from WFS feature type description
- Database Data Source
  - Generate model from external database (Oracle/ PostgreSQL)
- S-57 Data Source
  - Generate model and import features from S-57 file

## No pre-defined data model

- Changing data definitions on-the-fly:
  - Traditionally:
    - x, y, depth
    - S-57 (fixed set of feature definitions)
  - Nowadays:
    - Additional attributes (e.g. time), backscatter data
    - S-100/S-101/S-102 (plug-and-play data models)
  - Future:
    - More data definitions to come?

## Changing metadata definitions

- Changing metadata definitions:
  - Traditionally:
    - No standardized metadata definitions
    - Metadata for specific domains
  - Nowadays:
    - Metadata standards mostly based on ISO19115 (e.g. S-102)
    - Combination of metadata standards and internal metadata requirements
  - Future:
    - Changing metadata standards and requirements

## Map and link from source to target data models

## Managing point clouds

- Fast point cloud import, retrieval and visualisation
- Querying on point cloud metadata attributes
- Showing point cloud footprints on chart
- Visualisation of point cloud data on chart
- For integrated quality control of point clouds:
  - Correct coordinate system transformations applied
  - Correct vertical datum
  - Same units for attributes

## Import algorithm

- No limitations on number of points, point cloud size, physical memory or hard disk size
- Algorithm does not require any prior knowledge about number of points or MBR
- Optimized database storage of data chunks, no proprietary data types (database independent)
- Automatic generation of visualisation pyramid
- Automatic delineation of point cloud foot print (TIN)

# IntellinQ

Spatial Data Management

## Point cloud footprints and attribute data

The screenshot displays the IntellinQ interface. On the left, a 'Datasets' panel shows a list of bathymetry datasets for Zeeland. The main area contains two map views. The left map shows a point cloud footprint, and the right map shows a depth heatmap.

**Datasets Panel:**

- Datasource: Bathymetry
- Dataset class: Bathymetric survey
- Name: Zeeland
- Type class: Depth

Name	Type class	Datasource	Size
Zeeland1875	Depth	Bathymetry	341148
Zeeland1871	Depth	Bathymetry	2263961
Zeeland1984	Depth	Bathymetry	1566375
Zeeland1846	Depth	Bathymetry	1374262
Zeeland1988	Depth	Bathymetry	531921
Zeeland1883	Depth	Bathymetry	1114425
Zeeland1847	Depth	Bathymetry	1111289
Zeeland1890	Depth	Bathymetry	391011
Zeeland1915	Depth	Bathymetry	1022746
Zeeland1889	Depth	Bathymetry	454424
Zeeland1867	Depth	Bathymetry	1094817
Zeeland1888	Depth	Bathymetry	531921
Zeeland1924	Depth	Bathymetry	2201529
Zeeland1879	Depth	Bathymetry	827012
Zeeland1874	Depth	Bathymetry	330286

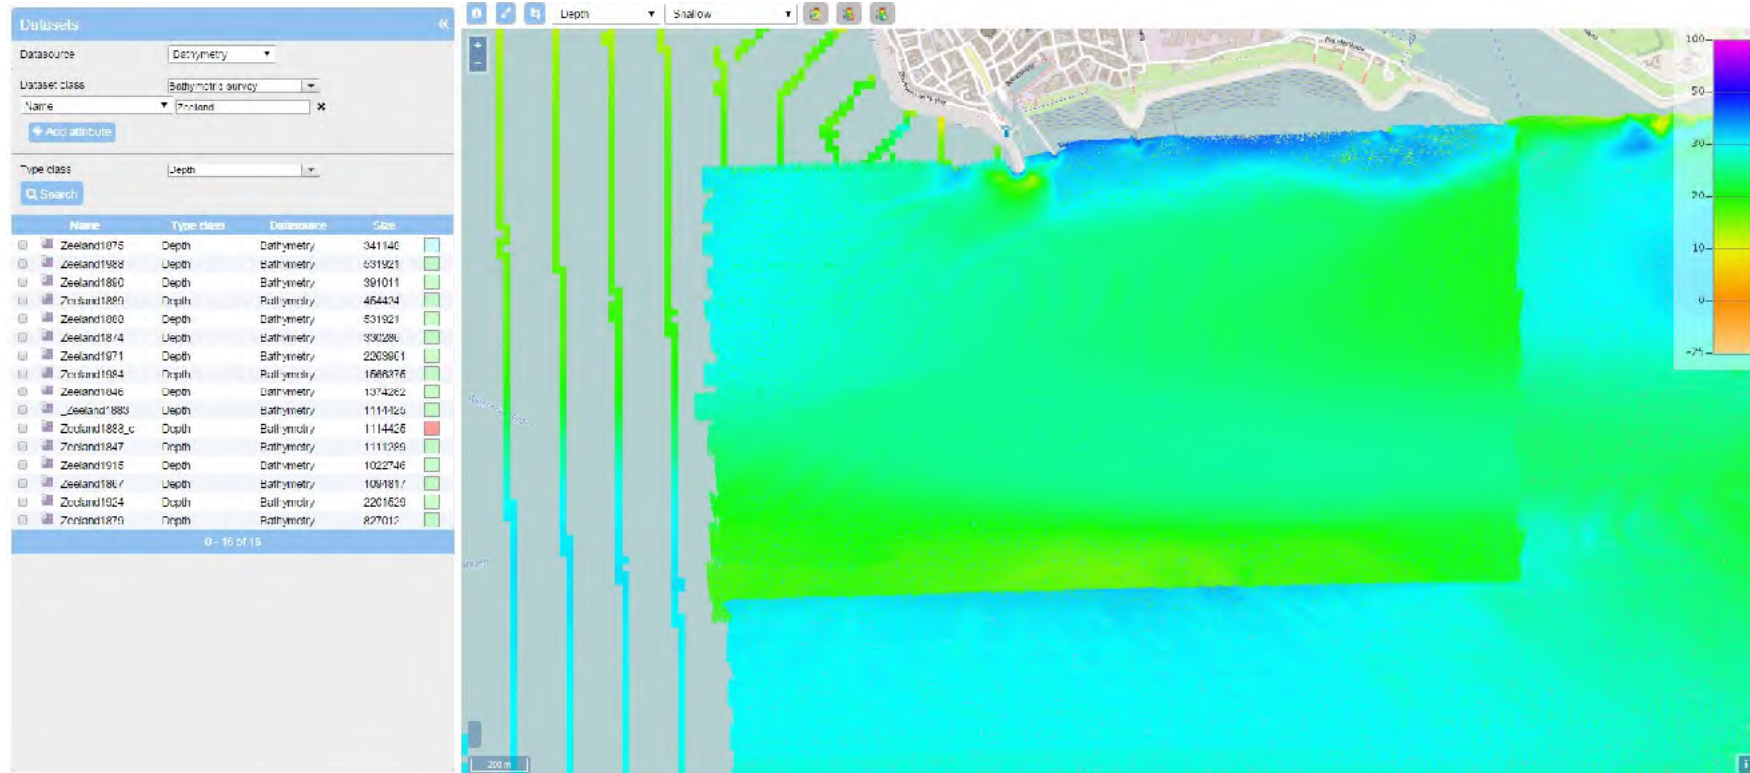

**Map Views:**

- Left Map:** Shows a point cloud footprint of a coastal area. The 'Select attribute' dropdown is set to 'Depth'. The map shows a large green area representing the footprint, with a blue area representing the water body.
- Right Map:** Shows a depth heatmap of the same area. The 'Depth' dropdown is set to 'Shallow'. The map shows a color gradient from blue (shallow) to red (deeper), with a large red area representing the shallow water body.

# IntellinQ

Spatial Data Management

## Quality control

## Data publishing: Export, Services and REST

- Export data as files
  - Tabular ASCII, Geotiff, LAS, Shape
  - Other file formats on request.
- OWS web services meet end-user information needs:
  - WMS Services
  - WFS Services
- Authenticated REST services
  - http request to access data structures and data

## Easy sharing of point cloud data

- Web based
- Publishing using different technologies (file as well as web service)
- Open standards and Open data
- Spatial and metadata querying
- User-defined styling

## Publishing as service

The screenshot displays the IntellinQ interface with three main components:

- Datasets Panel:** Shows a list of bathymetry datasets. The 'Type class' is set to 'Depth'. The table below lists the datasets:

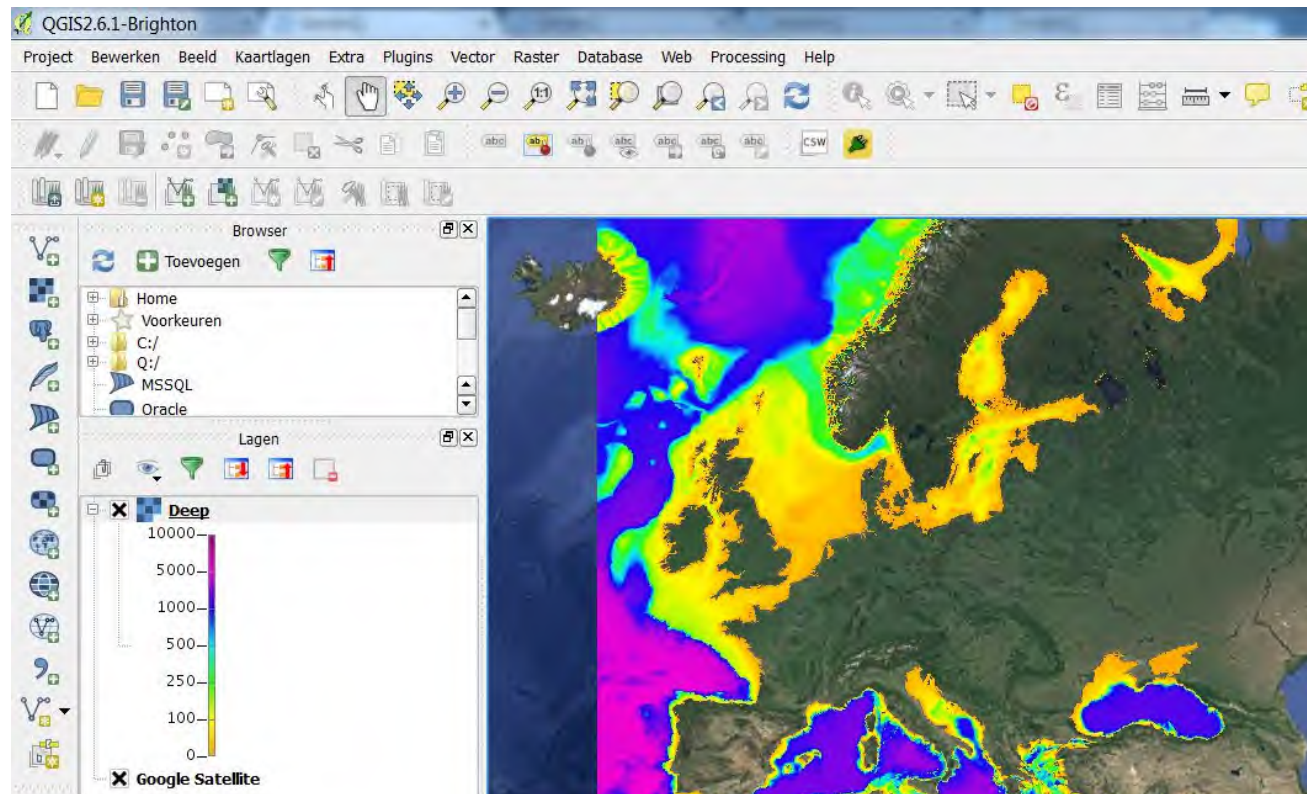

Name	Type class	Datasource	Size
EMODNET_D2	Depth	Bathymetry	9817616
EMODNET_C2	Depth	Bathymetry	34692998
EMODNET_B2	Depth	Bathymetry	64428030
EMODNET_B3	Depth	Bathymetry	43897473
EMODNET_C3	Depth	Bathymetry	14561405
EMODNET_D3	Depth	Bathymetry	12646562
EMODNET_C4	Depth	Bathymetry	25218517
EMODNET_D4	Depth	Bathymetry	18216381
EMODNET_B4	Depth	Bathymetry	27496897

**Map:** A bathymetry map of the Mediterranean region, showing depth contours. A vertical color scale on the right indicates depth from 0 to 10000 meters.

**Service Publishing:** The 'Service urls' tab is active, showing a form to publish a service. The 'Name' is 'bathymetry' and the 'Description' is 'bathymetry'. The 'Host' is 'demo.geolinq.nl' and the 'Path' is '/bathymetry'. The 'Layers' panel shows the published service as 'bathymetry'.
